

Description Project

In order to create a successful project, we divided the project into parts that will help us decided and organize the entire project.

1. We discussed and analyzed the project purpose. We already know that our goal is to schedule section for courses for CIS department.
2. We will learn more about HTML and PHP and how they interact each other
6. Create a web page that accepts desire input from the user. Those inputs will request information and add information to our database.
4. Create a database that hold information about the CIS department (room, class number, section, hours).
5. The CIS information will be given to us as a CSV file and we have to import that file into our database.
7. Connect our web page with the database using Xampp.
8. Develop an algorithm that will schedule the classes and will show rooms available from our database.
8. After creating the program, we will taste the program from a possible bug.
9. At the end we will add more details or a clearer design to our Webpage.
